**A USER'S MANUAL FOR THE ARL MATHEMATICAL
MODEL OF THE SEA KING MK 50 HELICOPTER:
PART II - USE WITH ARL FLIGHT DATA**

by

A. M. ARNEY and N. E. GILBERT

SUMMARY

A mathematical model of the Sea King Mk 50 helicopter, as used in the Anti-Submarine Warfare (ASW) role, has been developed at ARL to run on the Elxsi 6400 computer. To validate this model, extensive flight trials have been conducted by the RAN. This document provides a catalogue of the many flight trials data files, shows how to access and process the flight data, and then how to run the mathematical model with inputs obtained from the flight data.

1. INTRODUCTION

A mathematical model of the Sea King Mk 50 helicopter, as used in the ASW (Anti-Submarine Warfare) role, has been developed by ARL to a Royal Australian Navy (RAN) task requirement. This model, which was originally developed on a DEC System 10 computer using the simulation language "CSMP-10(ARL)" (Refs 1-3), has been described in general terms in Refs 4 and 5. Full descriptions of the main components, namely the Aerodynamics/ Kinematics, Control Systems, and Cable/Sonar may be found in Refs 6-11. A large data bank derived from an extensive series of Sea King flight trials (Ref. 12) is presently available, the processing of which, together with the application of filtering and kinematic consistency checking procedures, has been described in Refs 13-16. The main purpose of the trials was the acquisition of data for the validation of the mathematical model (Ref. 17).

Assuming a basic knowledge in using the Elxsi 6400 computer, the use of the computer programs associated with the Sea King model is described in three user manuals. Part I (Ref. 18) shows how to set up the model and run it in its basic modes without dunking sonar. The model is first run in ASW mode as a means of trimming the aircraft, i.e. 'flying to trim', and then in either ASW, ASE (Auto Stabilizing Equipment), or pilot modes to simulate a desired manoeuvre. Part II (this one) provides a catalogue of the many flight trials data files (not included in Ref. 12), shows how to access and process the flight data, and then how to run the mathematical model with inputs obtained from the flight data. Part III (Ref. 19) shows how to use the dunking sonar model and demonstrates the use of a cable graphics program.

2. RETRIEVAL OF FLIGHT DATA FROM MAGNETIC TAPE

The unprocessed flight trials data files are available on ARL magnetic tape M135. An example is given below of how to obtain these files, a catalogue of which is given in Appendix A.

To retrieve these files, a request is first made to the operator for tape M135 to be mounted:¹

```
:MOUNTTAPE M135 -W
:
***From operator at 11:32: Mag tape mounted on tape1
:TAPES
Device Status
device          user          volume   type      density   ring
-----
tape1
tape2           M135      ANSI     6250bpi   No
tape3
No outstanding mount requests for user ae.amey
:
```

¹ For computer terminal input included in this document, messages typed by the user are shown in bold type.

In order to copy one or more of these files from tape M135 to the current directory, shellfile REDATA is available on tape M228 (see Appendix A of Ref. 18). A listing of this file is shown below:

```
:LIST REDATA
- - SHELLFILE TO RESTORE LIST OF FILES FROM MTAPE
parm file +list +req
- - Init shellvariables, 'files'=pathname, 'count' is a counter
set filelist '' +declare
set count 1 +declare
set filelist [cat /subdomains/ar1/user/ae.williams/seaking/flight_data/ &
             [file [count]]] +append
- - Start of loop to add list of files to pathname
label loop
set count [eval count+1]
- - If another file is there add to pathname otherwise restore files
if [file [count]] then
    set filelist [cat "/subdomains/ar1/user/ae.williams/seaking/flight_data/" &
                 [file [count]]] +append
    goto loop
else
    goto restore
end if
- - Restore files
label restore
restore [filelist;noquote] vol=M135 merge=flat SEQ=1 -unl +cre
:
```

Below is an example showing how REDATA is used to restore flight data files 15018 and 15019, assuming the user has mounted tape M135.

```
:REDATA 15018,15019
15018
15019
***** RESTORE SUMMARY *****
2 files restored.
0 files not restored.
0 directories restored.
0 directories not restored.
All requests were found on tape.
:
```

3. PROCESSING THE FLIGHT DATA

The raw flight data is processed using the data processing program REFIN, (see Refs 13-16). The program requires the calibration file CAL86 (see Appendix B), which, as well as containing details of the instrument calibrations, also contains labels, plot limits, and characteristics of various filters used. Since REFIN was originally documented in Ref. 13, a digital notch filter has been added (Ref. 16). However, the processing time is

increased dramatically, and it is usually only used for special cases. Both REFINe and CAL86 are available on ARL magnetic tape M228.

For the flight data file 15018, selected here as an example, REFINe is run as follows:

```
:REFINE
INPUT DATA FILENAME = 15018
".DAT" OUTPUT FILENAME (w/o ext) =
TITLE (2 lines of 60 chrs)
:15018 - Hover - Pedal Pulse Port - ASE on - Flt 4

Ch.18 measures torque or yaw attitude

Used in special cases

Found with experience

Found with experience

Fortran program executed STOP statement 1

:

The above run creates the files 15018.ERR and 15018.DAT. File 15018.ERR contains a list of errors encountered, including time corrections, blocks replaced, and drop-outs. File 15018.DAT contains the processed data in a format suitable for use as input to the post processing program TRANS (see Sections 4.2 and 5).

It should be noted that suspect angular measurements were recorded in some flights, particularly of yaw angle and yaw rate. These can be detected by comparing with values derived through kinematic consistency checking (Ref. 15).¹ The faulty measurements may then be replaced by the alternatively derived (by integration or differentiation of other measured quantities) values (see Appendix B of Ref. 15).

4. RUNNING THE SEA KING MODEL WITH FLIGHT DATA INPUTS

4.1 Standard Input Files

As described in Section 5.1 of Ref. 18, whenever the model is run, the following three files are required as input:

- BOMMP.IN - Non-interactive command file for BOMMP
- DATA.HEL - Helicopter input data, mainly in NAMELIST form
- ?????.MOD - Helicopter model information in form of configuration, parameter, and function statements - must have 5 character name with .MOD extension

Standard helicopter input files and corresponding model files for ASW mode are available at All-Up-Weight (AUW) values of 16600, 17800, and 19200 lb. Where conditions need to be represented more specifically, the input data file (DATA.HEL) can be edited and the model file can be created by re-trimming in ASW mode (see Section 5.2 of Ref. 18).

4.2 Flight Control Inputs

4.2.1 Pedal Inputs

For the file 15018 processed in Section 3, the AUW is given as 16640 lb in Appendix A. Because this is close to the value 16600 lb, the standard files 16600.HEL (renamed to DATA.HEL) and 16ASW.MOD are used. The program SKMODE (see Section 5.3 of Ref. 18) is first run, as shown below, to obtain the ASE mode file 16ASE.MOD:

```
:SKMODE
INPUT FILE (ASW MODE .MOD FILE) : 16ASW
MODEL FILE REQUIRED (ASW,ASE,PIL OR ALL) : ASE
OUTPUT FILE (ASE MODE .MOD FILE) : 16ASE
??ASE.MOD TITLE : SEA KING - Hover - 3000 ft - ASE MODE - 16600lb AUW
:
```

¹ Flight data files which have previously been found to have faulty data are indicated in Appendix A.

The file BOMMP.IN is then edited, replacing 19ASW by 16ASE, to give:

```
:LIST BOMMP.IN
LOG2:16ASE_I
CON
PAR
FUN
MAN
:
```

Finally, a special file containing the flight data control inputs is created using the program TRANS (Refs 2 and 3), which is available on ARL magnetic tape M228. This file is read in by the Sea King model, any deviation from the initial control position being added to the model trim condition. Using the data file 15018.DAT (created in Section 3) as input to TRANS, the file 15018.COL (see Appendix C) is created for use as input to the Sea King model as shown below:

```
:TRANS
[TRANS version date 11-MAR-86]

I/P FILENAME = 15018
15018 - Hover - Pedal Pulse Port - ASE on - Flt 4

I/P FILE RECORDED ON 09-Jan-87 AT 14:56:57

INTEGN INT = .0000E+00; RUN CPU TIME = 24.98 SEC.

** RUNNING **

*EXI
:
```

Having prepared all the relevant files (i.e. BOMMP.IN, 16ASE.MOD, DATA.HEL, and 15018.COL), the model may now be run. Depending on the type of input, a number of switches need to be turned on or off. The example below shows how this is done using the PARAmeter command, for the case here (see Appendix A), where there is a pedal input with the Automatic Stabilizing Equipment (ASE) on:

*EXI

Fortran program executed STOP statement 0

:

The above example creates the output file 1518A.DAT, which can then be used as input to program TRANS, to produce suitable output in tabular or graphical form (see Section 5).

Further explanation of the switches set using the PARAmeter command is now made. When reading flight control inputs, the cyclic stick and collective stick positions are always read (Blks 57 and 87), as well as a yaw channel input (Blk 74). For pedal inputs, the yaw push-pull-rod movements are read (Blk 79 = 1), whereas for other inputs, the pedal position is read (Blk 79 = 0). This is because the yaw control system is not modelled correctly, and variables required to model the system were not measured (Ref. 17). In the case of a pedal input, a pedal position is derived from the push-pull-rod position, assuming no input from the ASE, and making no allowance for the faulty modelling. For 'ASE on' modelling, the yaw channel should be turned off (Blks 123 and 274), since ASE inputs are already included in the yaw push-pull-rod flight data. The Sea King model also has the facility to read in flight data blade angles (Blks 90 and 241), instead of control positions, thus by-passing the modelling of the flight control system.

4.2.2 Non-Pedal Inputs

Below is an example of how the model is normally run for non-pedal inputs, file 15019 representing a collective input manoeuvre:

:SEAKING86

MAX BLK NO. = 500

The output data stored as file 1519A.DAT may then be processed using TRANS (see Section 5).

4.3 Engine Cut

During the Sea King flight trials (Ref. 12), a number of tests were done simulating an engine failure, where one engine was closed down to idle, while the other engine automatically increased power. In order to simulate these tests with the Sea King model, a number of changes had to be made to a model file, while leaving the Fortran source files unchanged.

For the file 19092 considered, Appendix A gives the AUW as 19100 lb, the aircraft forward speed as 80 KIAS, and a cut of Engine 2. Being close to the AUW of 19200 lb, the standard files 19200.HEL (renamed to DATA.HEL) and 19ASW.MOD are used.

On inspecting the processed flight data (in which Channel 18 measures torque), it was found that the aircraft was actually at a forward speed of 82 kn in a 4 deg climb. The following steps are required to achieve a trimmed 'ASE mode' model file.

Initially, the 'ASW mode' is used to 'fly to trim' with a forward velocity of 82 kn (138.4 ft/s) in level flight. This is demonstrated in the example below, where set forward

speed (Blk 51) is ramped from 0 to 138.4 over a 200 second interval, and then set constant at 138.4 for a further 200 seconds to stabilize the trim:

5. COMPARING FLIGHT DATA WITH SEA KING MODEL RESULTS

As well as being able to obtain output, in tabular or graphical form, of either the flight data or Sea King model results separately, the program TRANS (Refs 1-3) may also be used to overlay plots from both for comparison purposes. An example is now given on comparing processed flight data (15018.DAT) obtained in Section 3 with corresponding model data (1518A.DAT) obtained in Section 4.2.1.

Though TRANS allows plot limits to be set automatically, this is inadvisable when obtaining overlay plots, as the scales are determined by the initial data file and may not be appropriate for subsequent data files plotted as overlays. It is recommended therefore that the plot limits be set using the SCALE command, either creating the limits interactively or reading them in from existing scale files TRANS.SCA and REPT.SCA. The file TRANS.SCA is used by the first data file, and the file REPT.SCA, which should be a copy of TRANS.SCA, is used by subsequent data files to be plotted as overlays. For the case here, the file HOVER.SCA, which is on ARL magnetic tape M228, should be renamed TRANS.SCA and then copied as REPT.SCA.

To avoid the tedious retyping of block numbers that are commonly required to be output in groups, it is advisable to use a TRANS.BLK file, which contains lists of each group of blocks to be output together (usually eight variables in 'strip' plot form to a page). For the present case, the standard TRANS.BLK file (on tape M228), which was originally generated using the LIST command (a TRANS command rather than the Elxsi operating command), is used.

Given the files HOVER.SCA (renamed to TRANS.SCA and REPT.SCA) and TRANS.BLK, which are listed in Appendix F, TRANS can now be run as follows:

:TRANS

[TRANS version date 11-MAR-86]

6. CONCLUDING REMARKS

Perhaps the most significant achievement in developing the Sea King model has been the extent to which it has been validated against flight data. The capabilities of the model, as well as limitations, are consequently reasonably well understood. However, this and any further validation requires a knowledge of how to process the ARL flight data, as well as how to run the model using these data as inputs in order to ensure compatibility between theoretical and experimental results. To keep alive this capability, especially following transfer of the model and flight data from the obsolete DEC System 10 to the Elxsi 6400, it has been necessary therefore to fully document all aspects of the model in the form of these user manuals. Inclusion here of a comprehensive catalogue of the computer records of the flight data has been considered necessary in view of current expectations on the value of the flight data in future studies, both in the application of parameter identification techniques to helicopter modelling and in the validation of a Sea King analysis, rather than simulation, model being developed using the CAMRAD (Comprehensive Analytical Model of Rotorcraft Aerodynamics and Dynamics) code.

APPENDIX D - Simulated Failure of One Engine

APPENDIX E

Model Modifications for Single Engine Cut

A description of the standard engine model as simulated in CSMP-10(ARL) is given in Fig. 7 of Ref. 6. The changes to this model (via CONfiguration, PARAmeter, and FUNction commands) are shown in Figure E.1 of this appendix.

In order to model the response of a single engine, the model is modified so that the response of the cut engine (Engine 2) is fed in as a FUNction block, with a first order lag simulating the torque decay.

Referring to Figure E.1, the detailed changes are as follows:

Blk

- 302 Gain of 250 is halved to 125
- 313 Initial condition halved; time constant unchanged from standard value
- 314 Initial condition halved; time constant unchanged from standard value
- 325 Initial condition is half of total engine torque (lb ft); time constant = 0.3 s (found from inspection of flight data)
- 327 Gain of 3.18×10^{-3} to convert torque (lb ft) to %¹ (see below)
- 328 Gain of 3.18×10^{-3} to convert torque (lb ft) to % (see below)

Calculation of Gains for Blks 327, 328:

From Ref. 20,

$$111\% \text{ torque} \equiv 2778 \text{ SHP at } 103\% \text{ Nr}$$

$$\text{and } 100\% \text{ Nr} \equiv 203 \text{ rpm}$$

$$\therefore 103\% \text{ Nr} \equiv 1.03 \times 203 \approx 209 \text{ rpm} = 21.89 \text{ rad/s}$$

$$\Rightarrow 111\% \text{ torque} = \left(\frac{2778 \times 550}{21.89} \right) \approx 69810 \text{ lb ft for two engines}$$

Hence, for one engine,

$$\text{Gain} = \left(\frac{111}{0.5 \times 69810} \right) = 3.18 \times 10^{-3}$$

¹ % is unit displayed on cockpit gauge and is based on a nominal value (used for torque and rotor revs, Nr).

14. DESCRIPTORS Westland Sea King Mk 50 helicopter, Antisubmarine warfare Mathematical models Flight simulation, (Australia) (SDU)		15. DRDA SUBJECT CATEGORIES 0074C	
16. ABSTRACT A mathematical model of the Sea King Mk 50 helicopter, as used in the Anti-Submarine Warfare (ASW) role, has been developed at ARL to run on the ELXSI 6400 computer. To validate this model, extensive flight trials have been conducted by the RAN. This document provides a catalogue of the many flight trials data files, shows how to access and process the flight data, and then how to run the mathematical model with inputs obtained from the flight data.
